1 GENERAL WARNINGS AND INFORMATION FOR ALL USERS

1.1 WARRANTY

This product is guaranteed for 5 years from the date of purchase for all manufacturing defects.

Please take a look at the terms and conditions described on the warranty certificate at the end of the manual.

1.2 AFTER SALES SERVICE

B&C Electronics offers to all of its customers the following services:

- a free of charge technical assistance over the phone and email for problems regarding installation, calibration and regular maintenance;
- a repairing service in our Carnate (Italy) headquarter for all types of damages, calibration or for a scheduled maintenance.

Please take a look at the technical support data sheet at the end of the manual for more details.

1.3 CE MARKING

This instrument is manufactured according to the following european community directives:

- 2011/65/EU "Restriction of the use of certain hazardous substances in electrical and electronic equipment"
- 2014/30/EU "Electromagnetic compatibility" EMC
- EN 61326-2-3/2013 "Electromagnetic compatibility" EMC
 - Industrial electromagnetic environment
- EN 55011/2009 "Radio-frequency disturbance characteristics"
 - Class A (devices for usage in all establishment other than domestic)
 - Group 1 (Industrial equipment that do not exceed 9kHz)

The **CE** marking is placed on the packaging and on the S/N label of the instrument.

1.4 SAFETY WARNINGS

It is important to underline the fact that electronic instruments are subject to accidental failure. For this, it is important to take all necessary precautions to avoid damages caused by malfunctions.

Any operation must be performed by authorized and trained staff.

The use must comply with the parameters described in chapter "Specifications and technical data (page 8)", in order to avoid potential damages and a reduction of its operating life.

1.5 SPECIAL WARNINGS

In order to ensure a reliable operation and to prevent irreversible damage, it is important to avoid all of the following:

- prolonged exposure to direct sunlight;
- cleaning too frequently and excessive air pressure;
- leaving the compressed air input device open if not used;
- unscrewing or loosening the cable gland or the probe body.

1.6 MANUAL REVISIONS

This chapter shortly describes the differences between previously released versions of the same manual, so to help users that are already familiar with the product.

2 PRODUCT OVERVIEW

2.1 FUNCTIONAL PURPOSE OF THE DEVICE

This probe has been designed to measure high turbidity and suspended solids according to the back scattering technology.

Applications

The main applications include drinking water, civil and industrial treatment and water quality monitoring.

Models

- TU 8355 for submersible applications, provided with an autoclean nozzle for external pressure air.
- TU 8555 for in flow application into flow cell or in pipe.
- TU 8555.5 for in flow application into flow cell or in pipe, PVDF body.

Probe composition

The measuring system consists of:

- infrared light source;
- back scattered light detector;
- clean lens status detector;
- temperature sensor;
- built-in 2-wire 4-20 mA transmitter;
- RS 485 output with B&C protocol for data transmission, calibration and configuration procedures.

The probe can operate in analog or digital mode (see chapter "Operating procedure (page 20)").

The TU 8355 probe is equipped with a device for automatic cleaning consisting of a conduit and by an injector which directs a jet of compressed air on the sensitive part, keeping it clean from incrustations and deposits of organic substances.

The probe can work connected as a slave to the MC 6587 and MC 7687 instruments that function as master.

2.2 ACCESSORIES

Sensors and accessories for different applications are available, to be ordered separately.

Our staff is always available to help costumers select the most appropriate and suitable solution for their specific needs.

Accessories

BC 8701 RS485/USB converter with Vdc output

Accessories for TU 8355

0012.450043 adapter for extension pipe

0012.000624 swivel mounting for extension pipe (0012.450043 is included)

0012.440040 PVC tubing for pressure air, L = 33 m

Accessories for TU 8555

TU 910 flow cell

TU 920 flow cell

1892702 adapter for installation in pipe

2713118 O ring for 1892702

SZ 7521 adapter for extension pipe

3 INSTRUCTION MANUAL CONTENTS

This chapter describes the manual and gives suggestions to all users on how to read it and use it.

The manual is written according to the following norms:

- UNI 10893 "Instructions for use";
- UNI 10653 "Quality of product technical documentation".

The terminologies indicated in the international metrology vocabulary (VIM) are respected as far as possible.

3.1 SYMBOLS

Throughout the manual you may find the following symbols, which are both dictated by a norm or that are simply conventional.

WARNINGS: this symbol is used to warn users that if the instructions are ignored or not correctly followed, damage to the instrument can be caused.

NOTE: *this symbol is to invite the user to pay particular attention to a specific section of the manual.*

3.2 HOW TO READ THE INSTRUCTION MANUAL

The manual contains all the information needed to acquire full knowledge of the product, to ensure a proper installation, proper use and maintenance in order to achieve the desired result at the time of its choice.

The manual is aimed at staff with appropriate knowledge and experience in the field of measurement and control through the use of sensors and transmitters in the context of industrial plants.

The index of the manual refers the reader to the chapters on aspects that want to learn and develop.

In particular, the first chapters show general topics and allow the user to become familiar with the product, with its functional purpose and with the necessary accessories or options for its use.

The user can then check whether he knows all the elements necessary for the use of the instrument and of the measuring/control.

4 SPECIFICATIONS AND TECHNICAL DATA

4.1 FUNCTIONAL SPECIFICATION

Inputs

The probe is able to perform the measurement of turbidity (suspended solids) and temperature.

Scale

The instrument allows the selection of three different scales: 100.0 / 1000 / 10000 FTU. For all it is possible to set the scalability factor to obtain different full scale values on the analogue output.

The suspended solid scale TSS is completely configurable both for measurement units and for full scale value.

Check signal

The probe is capable of detecting problems that alter the measure, such as dirt on the optical windows, lack of contact with liquid and external light too high.

The fault condition is signaled by an alarm on the analog output and an error flag on the record transmitted through the digital output.

Analog output

The probe operates in current loop 4-20 mA proportional to the value of the principal measure.

The output is galvanically isolated, so to be interfaced directly to a PLC, data acquisition cards or B&C Electronics instruments with 4-20 mA input.

Serial interface

Through the isolated RS485 interface, the user can connect the probe to a terminal or to a PC using a simple terminal emulation program. A RS485/RS232 or RS485/USB converter can be necessary.

Using B&C protocol, is possible measurements receiving, parameters setting and to calibration management.

Using Modbus protocol, functions 03, 06 and 16 are implemented for reading the measurements, changing the operating parameters and calibrating.

The MC 6587 and MC 7687 controllers from B&C Electronics allow complete management of the probe.

The bootloader function allows the firmware's update via serial port.

Filter software

The input signal has a filter with two selectable response time.

The user can separately set the response time relative to signals of small or large variation in order to obtain good reading stability and fast response to the variations of the measurement in the process.

In digital mode, the software filter acts only if the time interval between queries is significantly lower than the set filter time.

Power supply

The instrument is powered (min. 9 Vdc ÷ max. 36 Vdc) through the current loop, directly from a PLC or data acquisition boards that provide the power, or by a power supply in series between the analog output and the apparatus of acquisition.

When operating in digital mode the instrument is powered using the terminals of the current loop.

Configuration and calibration of the probe

Configuration and calibration of the probe are made via serial interface (see chapter "Digital mode (page 21)").

4.2 TECHNICAL DATA

4.2.1 GENERAL SPECIFICATIONS

Common specification

| | |
|---------------------------|--------------------------------------|
| Cable | 5 x 0.25 mmq, L= 10 m, sheath in PVC |
| Storage temperature | -5 °C ÷ +50 °C |

| TEMPERATURE | | Default |
|-------------------------------|----------------------|---------|
| Sensor for thermocompensation | RTD Pt100 (built-in) | |
| Compensation range | 0.0 ÷ 50.0 °C | |
| Temperature comp. coefficient | internal table | |

| EXTERNAL LIGHT EVALUATION | | Default |
|---------------------------|---------------|---------|
| Scale | 0.0 ÷ 100.0 % | |
| Alarm | On / Off | Off |

| CURRENT LOOP (DIGITAL MODE = 0) | | Default |
|--|----------------------------------|---------|
| Current loop proportional to the measuring | 4-20 mA | |
| | | |
| Output scale factor | 10 ÷ 100 % | 100 % |
| | | |
| Under / Over range | 3.80 mA / 20.80 mA | |
| | | |
| ID of the selected scale | | |
| • Scale 100.0 FTU | 8 mA at switching-on for 16 s | |
| • Scale TSS for 100.0 FTU | 8.5 mA at switching-on for 16 s | |
| • Scale 10000 FTU | 12 mA at switching-on for 16 s | |
| • Scale TSS for 10000 FTU | 12.5 mA at switching-on for 16 s | |

| CURRENT LOOP (DIGITAL MODE = 0) | | Default |
|--|----------------------------------|---------|
| • Scale 10000 FTU | 20 mA at switching-on for 16 s | |
| • Scale TSS for 10000 FTU | 20.5 mA at switching-on for 16 s | |
| Under alarm condition (if activated) of the check signal of: | | |
| • dry cell; | | |
| • fouling; | | |
| • external light too high; | | |
| the analog output will show the following sequence: | | |
| • loop at 3.80 mA for 16 seconds; | | |
| • loop at 21.00 mA for 16 seconds. | | |
| The above sequence is repeated during the alarm conditions. | | |
| The analog output will restore automatically at the end of alarm conditions. | | |

| DIGITAL FUNCTION | | Default |
|--|---|-----------|
| Protocols | B&C protocol ASCII Modbus RTU The two protocols can coexist | |
| B&C ID protocol | ID = 01 ÷ 99 * last s/n digit, if 0 ID=10 | 01 ÷ 10 * |
| Modbus address | ID = 01 ÷ 243 * last s/n digit, if 0 ID=10 | 01 ÷ 10 * |
| Measures and parameters are provided under interrogation (see protocols B&C ASCII and Modbus RTU function 03) | | |

| SERIAL INTERFACE | | Default |
|-------------------------|---|-----------|
| Interface | RS 485 not terminated | |
| | Isolated from the sample | |
| | Not isolated from the loop/power supply | |
| Baud rate | 2400 / 4800 / 9600 / 19200 baud | 9600 baud |

5 INSTALLATION

5.1 PACKING LIST

The instrument package contains:

- N° 1 turbidity probe;
- N° 1 instruction manual.

5.2 UNPACKING AND REPACKING OF THE UNIT

- 1 Open the carton box and keep it.
- 2 Remove the probe wrapped in clear plastic guard.
- 3 Remove the plastic cap.

 Handle the probe with care.

If repackaging do the reverse.

5.3 STORAGE AND TRANSPORT

For prolonged storage, keep the product in dry places.

In the case of transportation, pack the product in the carton box.

5.4 INSTALLATION OF TU 8355

Use with autoclean system

The probe should be submerged preferably with an inclination that favors cleaning air escaping upwards.

The swivel mounting 0012.000624 described in chapter "Accessories (page 6)" allows this type of installation.

Before the immersion of the probe it is necessary to make the following:

- provide an extension pipe with suitable length;
- provide the PVC tubing 0012.440040 with suitable length;
- prepare the 0012.450043 adapter;
- insert the flexible tubing in the air connector;
- insert the cable and the tubing in the adapter 0012.450043 and screw it on the probe;
- insert the extension pipe and screw it on the adapter.

-  The pressure air provided by the customer must be a clean air at 3 bar max.

The typical cleaning time is 15 seconds and the typical cleaning frequency is 2 times/day, but it is depending of the application and the actual efficiency of the cleaning action.

Higher cleaning frequency could reduce the lifetime of optical lens, especially in the presence of abrasive suspended solids in the sample.

Use without autoclean system

Before the immersion of the probe, follow the above procedure but:

- do not install the flexible tubing;
- install a stopper on the air line connector in order to avoid the water entering into the room between the adapter and the probe when the probe is submersed.

-  Without the stopper the water will damage the cable and it may leak inside the probe.

-  The probe cable can be submerged but must check the compatibility of its PVC jacket with the sample liquid.
In any case it is necessary to periodically check that the cable is in good condition.

5.5 INSTALLATION OF TU 8555

This probe is designed for use online or in the flow cell TU 910 or TU 920 (refer to the latter's instructions for proper installation).

Is advisable to use the probe in the flow cell, especially in the case of measurements of turbidity up to 100 FTU.

- Insert the adapter with the O-ring on the probe;
- insert the probe into the flow cell;
- tighten the cell fixing ring nut.

In applications with high turbidity measures, the probe can also be installed directly in the flow, preferably in a bypass with shut-off valves in order to allow the removal of the probe for maintenance.

Contact our sales office for further clarification regarding this application.

The probe can also be installed in a tank with extension pipe adapter SZ 7521.

-  Do not unscrew/remove the cable gland fitting. You can damage the internal circuits.

Warranty will not be applied if sensors are tampered with.

5.6 ELECTRICAL INSTALLATION

Connect the probe to the meter by following the color of the wires of the cable.

The operation mode via the current loop uses the white and green wires which are protected against reversed connection.

The shield of the cable is not connected inside the probe but must be connected to the system ground.

| Wire colour | Function |
|-------------|----------------------------|
| Shield | not connected |
| Yellow | RS485 A (+) |
| Grey | RS485 B (-) |
| Brown | not connected |
| Green | + current loop |
| White | - current loop / COM RS485 |

Do not connect the power supply on the RS485 interface wires (yellow and gray) to prevent breakage.

Avoid interruptions of the cable. If needed, use junction boxes with high insulation and the extension cable p/n 2423405 (5x0.25 - D 5.70 mm).

Keep the cable away from the power cables also inside the electrical panel.

5.6.1 CONNECTION IN ANALOG MODE TO B&C INSTRUMENTS

In analog mode is possible to connect the turbidity probe to instruments BC 7335 - BC 7635 - BC 7687 - BC 6587 of B&C Electronics in order to simplify their use by their characteristics listed below:

- configuration of the scale corresponding to 4-20 mA input signal;
- zero adjustment and sensitivity;
- two independent set points;
- alarm relay minimum / maximum;
- isolated output 0-20 mA or 4-20 mA;
- digital input to maintain the instrument in terms of hold during calibration or in the cycle of self cleaning.

Connect the sensor to the controller as follows:

| Wire color | BC 7335 | BC 7635 | BC 7687 | BC 6587 |
|------------|---------|---------|---------|---------|
| Green | 20 | 20 | 20 | 25 |
| White | 22 | 22 | 22 | 23 |

Calibration

When the probe is connected to these controllers, you can calibrate the turbidity measurement using the zero/sensitivity adjustment available in the controllers and described in specific instruction manuals.

Working in this way avoids carry out the calibration of the probe by means of the digital connection that might be necessary only in case of degradation of the optical element.

5.6.2 NETWORK CONNECTION (RS485)

These digital probes use a RS485 driver with slow switching fronts.

This implies that it is not necessary to complete the termination of the transmission line even for long distances.

The following directions are to be considered as examples.

If the driver of the master device has very fast switching fronts, it may be necessary to terminate the beginning and end of the transmission line. In this case it should be inserted in the transmission line a pull-up and pull-down R_p resistors to keep the line polarized and to ensure the starting condition (start bit).

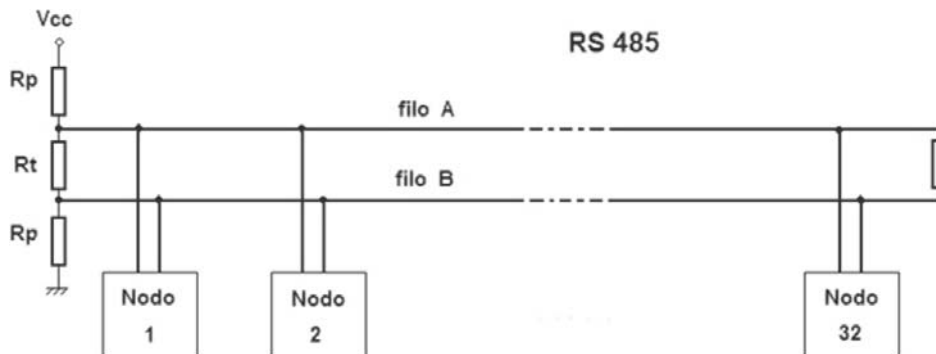

Fig. 1 Pull-up and pull-down resistors termination

If no power supply is available to insert the pull-up and pull-down resistances on the line, or to not overload the driver increasing the consumption of the sensors and devices, make an AC termination by inserting a capacitor in series with the terminating resistor.

Fig. 2 AC termination

The capacitors to be used depend on the length of the cables and as an indication they are the following:

10 nF (150 m) - 22 nF (300 m) - 47 nF (600 m) - 100 nF (1200 m).

5.6.3 CONNECTION IN DIGITAL MODE TO B&C INSTRUMENTS

In digital mode is possible to connect the turbidity probe to instruments MC 7687 and MC 6587 of B&C Electronics.

For the available functions, refer to the instruments specific manuals.

Connect the sensor to the controller as follows:

| Wire color | MC 7687 | MC 6587 |
|------------|---------|---------|
| Green | 40 | 35 |
| White | 37 | 32 |
| Yellow | 39 | 34 |
| Grey | 38 | 33 |

5.7 DISPOSAL

In the case of disposal of the instrument, apply the terms of the law provided for the disposal of electronic devices.

6 OPERATING PROCEDURE

6.1 OPERATING PRINCIPLE

The turbidity and suspended solid measurements are performed according to the back scattering method.

A light beam is sent to the sample through an optical lens.

The back scattered light by suspended particle is collected by the probe through a second lens and it is converted in an electric signal proportional to the turbidity of the sample.

TU 8355 e TU 8555 probes use an infrared light so the measuring is not effected by the color of the sample.

External light effect

The exposure of the probes to high external light can influence the turbidity measurement.

The circuits of the probe detect the external light that may effect the accuracy of the measuring.

If the effect cannot be automatically compensated, the probe sends an error message and an alarm if the analog operating mode has been selected.

The user must modify the installation in order to protect the lens from the sun or the stray light.

This effect is not present in the model TU 8555 because it is normally installed into the flow cell TU 910 / TU 920 or in pipe.

6.2 OPERATING MODE

The probe can be configured to operate in analog or digital mode.

For operation in analog mode you must configure "digital mode = 0".

For operation in digital mode you must configure "digital mode = 1 o 2".

When a new operating mode has been configured, the new configuration is active after the probe is powered off and back on.

6.3 ANALOG MODE

In analog mode, the probe provides a 4-20 mA output current loop isolated from the sample for direct connection to a PLC or to a data logger.

The probe in the analog mode can be connected to BC 7335 - BC 7635 - BC 7635.010 - BC 7687 - BC 6587 B&C Electronics instruments, which allow the visualization of the measure and have two set point on/off and an alarm window.

The probe is supplied with the factory configuration in analogue mode (digital mode = 0).

The probe requires 2 seconds from the switching on to stabilize the operation of the internal circuits.

After 2 seconds, the current loop settles for the next 16 seconds to set current values that allow the operator to identify the scale of measurement selected in the configuration:

- 8 mA for 0.0 ÷ 100.0 FTU scale;
- 12 mA for 0 ÷ 1000 FTU scale;
- 20 mA for 0 ÷ 10000 FTU scale.

If any RS485 serial interface activity is not detected during the time interval of 2 to 18 seconds from the switching on, the probe will enter definitively in analog mode with 4-20 mA current loop ignoring any subsequent activity present on the serial.

If during this interval an RS485 serial interface activities is detected, the probe will go into digital mode (typical absorption 7 mA, may be higher during transmission).

With check signal enabled (see "CHECK SIGNAL ACTIVATION (page 34)"), the current loop jumps between 3.8 mA and 21.0 mA every 15 seconds to indicate fouling or dry alarm, high external light or faulty measurement.

The sequence is ended when all the alarm condition are not present.

6.4 DIGITAL MODE

In digital mode the probe is a slave device that interacts with a master device through the RS485 serial interface.

In case of connection to a PC, a RS485/RS232 or RS485/USB (as BC 8701) converter can be required.

The communication is via the RS485 connection with the B&C protocol (ASCII) and Modbus RTU (function 03 - 06 -16) protocol described in the following chapters.

When switched on the probe requires 2 seconds to stabilize its internal circuits.

After that period, if configured for digital mode with the parameter "digital mode = 1" or "digital mode = 2", the probe is ready to receive commands from the master device or manually through the Hyperterminal program or similar.

After 8 seconds from the switching on, for digital mode = 1 the current loop will provide 8 / 12 / 20 mA in function of the selected scale.

For digital mode = 2 the current loop will provide 7 mA.

Alarm states are signaled with an error flag in the transmitted record.

6.4.1 B&C COMMUNICATION PROTOCOL

Connect the probe to a PC for data management and calibration, using a simple terminal emulation program (example Hyperterminal).

Mode of transmission

| | |
|-------------------------------|---------------------|
| Code system | ASCII |
| Number of bits per character: | |
| - start bits | 1 |
| - data bits | 8 |
| - parity | no parity |
| - stop bits | 1 |
| Error check (only A command) | BCC |
| Speed | 9600 baud (default) |

Command format using ID (01 ÷ 99) or (1 ÷ 99)

1 or 2 byte ID probe (01 ÷ 99 or 1 ÷ 99)

1 or 2 byte of command

n byte to be inserted if required by the command

1 byte <cr> (carriage return) end command

The probe transmits only if the ID sent is correct or is 00.

Do not use 00 ID if more than one probe is connected, to avoid overlap of the communication.

Command format using ID + SNxxxxxx

1 or 2 byte ID probe (01 ÷ 99 or 1 ÷ 99)

8 byte serial number (SNxxxxxx)

1 or 2 byte of command

n byte to be inserted if required by the command

1 byte <cr> (carriage return) end command

The probe transmits only if the ID + serial number sent is correct or if it is 00 + serial number.

If the communication port is set to a different speed the probe will not communicate.

All the available commands are listed in the following pages.

The list of commands implemented in the transmitter is always available by sending the command Help.

COMMANDS USING ID

HELP

Command format: ID + H <cr>

Example: if ID=14 type 14H <cr> or 00H <cr>

By sending the command H the probe responds by sending a record containing the list of available commands with a brief description of their meaning.

PARAMETERS QUERY

Command format: ID + H? <cr>

Example: if ID=14 type 14H? <cr> or 00H? <cr>

By sending the command H? displays a record containing the code and the identifier followed by all parameters including the results of calibrations.

The record transmitted uses the "," as separator.

Record format:

```
TU8X55- 02,FW:3.00,SN:123456,M:0000,O:0003,X:0100,RL:0040,RS:0120,V:

xx

2 byte BCC of transmitted record

The record transmission is ended by <cr> <lf>.

EEPROM BCC check use

The EEPROM BCC check is a summary of the probe configuration state. When the parameters are set and calibration has been done, the value of the BCC remains constant until the next change of parameters or calibration. A variation of the BCC value without changing any parameters means the probe's configuration data has been altered.

BCC calculation

The BCC messages sent by the probe is calculated as the XOR of all the bytes making up the message (excluding <cr> and <lf>) and divided into 2 nibble.

The two nibbles are then transformed into their ASCII codes.

The BCC transmitted at the end of record is used to check the validity of records received.

ACQUISITION

Command format: ID + A <cr>

Example: if ID=14 type 14A <cr> or 00A <cr>

By sending the command A, the probe responds by sending a record containing the code, the ID, date, time, and the value of all the measures.

Record format

- TSS measure OFF

```
TU8X55- 10 0.0 01/01/01 00:00:00 ± 100.0FTU ± 100.0% ± 20.0°C ±
.....|.....|.....|.....|.....|.....|.....|.....|
10% ± 200% ± 0err ± 36.0% ± 0err 18/11/10xx
```

- TSS measure ON

```
TU8X55- 10 0.0 01/01/01 00:00:00 ± 100.0FTU ± 100.0mg/l ± 1.000 ±
.....|.....|.....|.....|.....|.....|.....|.....|
100.0% ± 20.0°C ± 10% ± 200% ± 0err ± 36.0%
.....|.....|.....|.....|.....|.....|.....|.....|
± 0err 18/11/10xx
```

| | |
|----------|---------------------------------|
| TU8x55 | Probe code (TU 8355 or TU 8555) |
| 10 | Probe ID |
| 0.0 | Power voltage (not implemented) |
| 01/01/01 | Date (not implemented) |
| 00:00:00 | Time (not implemented) |

Below are transmitted the parameter values measured by the transmitter with the following format:

| | |
|----------------|--|
| Measuring | - Sign of measure (if positive is sent a blank) - Value of measure (6 characters - right alignment) |
| Measuring unit | - 4 characters - left alignment - 1 blank (ASCII 32) |
| ± 100.0 FTU | Turbidity value |
| ± 100.0 mg/l | TSS value (if TSS enabled) |
| ± 1.000 | TSS/FTU factor (if TSS enabled) |
| ± 100.0 % | Check signal value |
| ± 20.0 °C | Temperature |
| ± 10 % | Check fouling value |
| ± 200 % | Check dry value |
| ± 0err | check error 0= no error 1=fouling error 2=dry error |
| ± 36.0 % | Average signal value related to external light |
| ± 0err | Flag error 0= no error 1= high external light error 2= indeterminate measure error |

At the end of the record, the probe sends the date the last calibration procedure, then 2 bytes containing the BCC of the string sent.

| | |
|----------|-----------------------|
| 18/11/10 | Last calibration date |
| xx | 2 byte BCC |

The record transmission is ended by <cr> <lf>.

BCC calculation

The BCC messages sent by the transmitter is calculated as the XOR of all the bytes of the message (excluding <cr> and <lf>) and divided into two nibbles.

The two nibbles are then transformed into their ASCII codes.

BCC use

The BCC can be used if you want to create a master program that interrogates the probe.

The BCC is used to check the validity of records received.

DIGITAL MODE

Command format: ID + M + x <cr>

Example: if ID=14 and digital mode = 1 type 14M1 <cr> or 00M1 <cr>

Response of the unit: <cr> <lf> ID + M + x <cr> <lf> command executed correctly

Response of the unit: none command failed

The probe can be configured to operate in digital mode (digital mode = 1 or 2) or in analog 4-20 mA mode (digital mode = 0).

For this command, and for all the following commands the response of the sensor is a replica of the command received with the addition of a <lf> line feed (head) at the beginning and end of the response.

ANALOG OUTPUT

Command format: ID + O + x <cr>

Example: if ID=14 and analog out = 1000 FTU scale 14O2 <cr> or 00O2 <cr>

Response of the unit: <cr> <lf> ID + O + x <cr> <lf> command executed correctly

Response of the unit: none command failed

4-20 mA analogue output can be matched to one of the following scales.

Set parameter:

x=1 for 0.0 ÷ 100.0 FTU scale

x=2 for 0 ÷ 1000 FTU scale

x=3 for 0 ÷ 10000 FTU scale

The analogue output is associated with the TSS measurement if enabled.

TSS MEASURE

Command format: ID + N + x <cr>

Example: if ID=14 and TSS measure = ON type 14N1 <cr> or 00N1 <cr>

Response of the unit: <cr> <lf> ID + N + x <cr> <lf> command executed correctly

Response of the unit: none command failed

Set parameter:

x=0 for turbidity measure

x=1 for TSS measure

To check whether the entered value has been received type command H.

Enabling of TSS measurement acts on the 4 ÷ 20mA analogue retransmission and changes the format of the command A.

MEASURE UNIT FOR TSS

Command format: ID + U + x <cr>

Example: if ID=14 and TSS measure = mg/l type 14U6 <cr> or 00U6 <cr>

Response of the unit: <cr> <lf> ID + U + x <cr> <lf> command executed correctly

Response of the unit: none command failed

Set parameter:

x=1 for measure unit %
x=2 for measure unit ppt
x=3 for measure unit ppm
x=4 for measure unit ppb
x=5 for measure unit g/l
x=6 for measure unit mg/l
x=7 for measure unit µg/l

To check whether the entered value has been received type command H.

DECIMAL POINTS FOR TSS

Command format: ID + G + x <cr>

Example: if ID=14 and decimal points for TSS measure = 2 type 14G2 <cr> or 00G2 <cr>

Response of the unit: <cr> <lf> ID + G + x <cr> <lf> command executed correctly

Response of the unit: none command failed

The TSS decimal point changes only the value display but does not change the TSS/FTU conversion factor.

To check whether the entered value has been received type command H.

FULL SCALE FOR TSS

Command format: ID + W + x <cr>

Example: if ID=14 and full scale for TSS measure = 5000 type 14W5000 <cr> or 00W5000 <cr>

Response of the unit: <cr> <lf> ID + W + x <cr> <lf> command executed correctly

Response of the unit: none command failed

To check whether the entered value has been received type command H.

TSS/FTU FACTOR

Command format: ID + P + x <cr>

Example: if ID=14 and TSS/FTU factor = 0.500 type 14P0.500 <cr> or 00P0.500 <cr>

Response of the unit: <cr> <lf> ID + P + x <cr> <lf> command executed correctly

Response of the unit: none command failed

The conversion factor is applied to the turbidity value read by the probe.

Example with scale = 100.0 FTU, turbidity measure = 45.3 FTU, TSS measure unit = mg/l, TSS decimal points = 3:

| TSS/FTU factor | TSS value |
|----------------|------------|
| 0.010 | 0.04 mg/l |
| 0.100 | 0.45 mg/l |
| 1.000 | 45.3 mg/l |
| 10.000 | 45.30 mg/l |

Example with scale = 1000 FTU, turbidity measure = 674 FTU, TSS measure unit = g/l, TSS decimal points = 3:

| TSS/FTU factor | TSS value |
|----------------|-----------|
| 0.010 | 0.006 g/l |
| 0.100 | 0.067 g/l |
| 1.000 | 0.674 g/l |
| 10.000 | 6.740 g/l |

To check whether the entered value has been received type command H.

OUTPUT SCALE FACTOR

Command format: ID + X + x <cr>

Example: if ID=14 and scale factor is 50 % type 14X50 <cr> or 00X50 <cr>

Response of the unit: <cr> <lf> ID + X + x <cr> <lf> command executed correctly
Response of the unit: none command failed

To check whether the entered value has been received type command H.

Example of scale factors:

| Scale factor | Full scale value |
|--------------|------------------------|
| 100 % | 100 / 1000 / 10000 FTU |
| 50 % | 50 / 500 / 5000 FTU |
| 20 % | 20 / 200 / 2000 FTU |
| 10 % | 10 / 100 / 1000 FTU |

LARGE FILTER (Response time 90 % large signal)

Command format: ID + RL + x <cr>

Example: if ID=14 and the response time relative to signals of large variation is 100 s type 14RL100 <cr> or 00RL100 <cr>

Response of the unit: <cr> <lf> ID + RL + x <cr> <lf> command executed correctly
Response of the unit: none command failed

To check whether the entered value has been received type command H? or H.
The large filter can be set from 2 to 220 seconds.

SMALL FILTER (Response time 90 % small signal)

Command format: ID + RS + x <cr>

Example: if ID=14 and the response time relative to signals of small variation is 100 s type 14RL100 <cr> or 00RL100 <cr>

Response of the unit: <cr> <lf> ID + RS + x <cr> <lf> command executed correctly

Response of the unit: none command failed

To check whether the entered value has been received type command H? or H.
The small filter can be set from 2 to 220 seconds.

ZERO SOLUTION VALUE

It is preferable to use a turbidity standard for the zero calibration with FTU values close to zero.

The standard value for the zero calibration must be within the 100 FTU scale.

Command format: ID + V + x <cr>

Example: if ID=14 and the standard solution is 0.2 FTU type 14V0.2 <cr> or 00V0.2 <cr>

Response of the unit: <cr> <lf> ID + V + x <cr> <lf> command executed correctly

Response of the unit: none command failed

To check whether the entered value has been received type command H? or H.

SENSITIVITY SOLUTION VALUE

Command format: ID + T + x <cr>

Example: if ID=14 and the calibration solution is 100.0 FTU type 14T100.0 <cr> or 00T100.0 <cr>

Response of the unit: <cr> <lf> ID + T + x <cr> <lf> command executed correctly

Response of the unit: none command failed

To check whether the entered value has been received type command H? or H.

ZERO CALIBRATION

Perform the zero calibration with standard solution of zero or with a known turbidity solution.

The value of the solution should be inserted through the command "Zero solution value".
The zero calibration is performed on all three scales starting from the lower one.

Zero calibration should be performed before sensitivity calibration.

Command format: ID + Z <cr>

Example: if ID=14 type 14Z <cr> or 00Z <cr>

| | |
|--|----------------------------|
| Response of the unit: <cr> <lf> ID + Z <cr> <lf> | command executed correctly |
| Response of the unit: none | command failed |

Possible results:

| | |
|------------|-----------------------------------|
| 'ok' | calibration done |
| 'error' | error during calibration |
| 'not done' | default factory calibration value |

To check the result of the sensitivity calibration using the Z?, H? or H.

In the event of a successful test with the A, the reading in FTU must be close to the solution used for calibration.

 *If the operation has failed (error) is kept the value of the previous zero.*

Inspect the state of the surface of the lenses and, if necessary, clean the surface with a soft cloth.

ZERO CALIBRATION RESET

Command format: ID + ZR <cr>

Example: if ID=14 type 14ZR <cr> or 00ZR <cr>

| | |
|---|----------------------------|
| Response of the unit: <cr> <lf> ID + ZR <cr> <lf> | command executed correctly |
| Response of the unit: none | command failed |

This command allows you to restore the zero value to the default values.

Verify the outcome of the operation with the command Z?, H? or H and check the line "Zero calibration: not done".

ZERO CALIBRATION TEST

Command format: ID + Z? <cr>

Example: if ID=14 type 14Z? <cr> or 00Z? <cr>

| | |
|---|----------------------------|
| Response of the unit: <8 characters outcome> >blank> <7 characters value> <4 characters measure unit><cr> <lf> | command executed correctly |
| Response of the unit: none | command failed |

Record format

```
ok          ± 0.000NTU
...+...|...+...|...+...|...+...|...+...|...+...|...+...|
```

Possible results: ok / not done / error.

SENSITIVITY CALIBRATION

Perform the sensitivity calibration with formazine standard solution or with a known turbidity solution.

The value of the solution should be inserted through the command "Sensitivity solution value".

The zero calibration is performed on all three scales.

Command format: ID + S <cr>

Example: if ID=14 type 14S <cr> or 00S <cr>

Response of the unit: <cr> <lf> ID + S <cr> <lf>

Command executed correctly

Response of the unit: none

Command failed

Possible results:

| | |
|------------|-----------------------------------|
| 'ok' | calibration done |
| 'error' | error during calibration |
| 'not done' | default factory calibration value |

To check the result of the sensitivity calibration using the S?, H? or H.

Send a command A to test if calibration was successful. The reading in NTU should be as close as possible to the value of the solution used for calibration.

If the operation has failed (error) check that the probe is actually immersed in the standard solution.

Inspect the state of the surface of the lenses and, if necessary, clean the surface with a soft cloth.

In the case of a negative result the probe restores the previous values of sensitivity.

SENSITIVITY CALIBRATION RESET

Command format: ID + SR <cr>

Example: if ID=14 type 14SR <cr> or 00SR <cr>

Response of the unit: <cr> <lf> ID + SR <cr> <lf>

command executed correctly

Response of the unit: none

command failed

This command allows to return to the default sensitivity value of 100.0 %.

Verify the outcome of the operation through the command S?, H? o H and check the line "Sens. calibration: not done".

SENSITIVITY CALIBRATION TEST

Command format: ID + S? <cr>

Example: if ID=14 type 14S? <cr> or 00S? <cr>

Response of the unit: <8 characters outcome> command executed correctly
 >blank> <7 characters value>
 <4 characters measure
 unit><cr> <lf>

Response of the unit: none command failed

Record format

```
ok          ± 100.0%
.....+.....|.....+.....|.....+.....|.....+.....|.....+.....|.....+.....|.....+.....|
```

Possible results: ok / not done / error.

CHECK SIGNAL CALIBRATION

Before performing the calibration check the condition of the surface of the lenses and, if necessary, clean with a soft cloth.

The probe must be properly immersed in the liquid without the presence of air bubbles on the surface of the lenses.

Command format: ID + C <cr>

Example: if ID=14 type 14C <cr> or 00C <cr>

Response of the unit: <cr> <lf> ID + C <cr> <lf> command executed correctly

Response of the unit: none command failed

Possible results:

| | |
|------------|-----------------------------------|
| 'ok' | calibration done |
| 'error' | error during calibration |
| 'not done' | default factory calibration value |

The "Check signal cal.: not done" message will mean the parameter is turned to the default value through the command C?, H? o H.

In case of a positive outcome 'ok' check with the command A, the check signal reading should be about 100%.

CHECK SIGNAL RESET

Command format: ID + CR <cr>

Example: if ID=14 type 14CR <cr> or 00CR <cr>

Response of the unit: <cr> <lf> ID + CR <cr> <lf> command executed correctly

Response of the unit: none command failed

This command is for turning the check signal to the default value 100%.

To verify the calibration results of the control signal using the C?, H? or H and check the line "Check signal cal.: not done."

CHECK SIGNAL CALIBRATION TEST

Command format: ID + C? <cr>

Example: if ID=14 type 14C? <cr> or 00C? <cr>

Response of the unit: <8 characters outcome> command executed correctly
 >blank> <7 characters value>
 <4 characters measure
 unit><cr> <lf>

Response of the unit: none command failed

Record format

```
ok           ± 100.0%
.....+.....|.....+.....|.....+.....|.....+.....|.....+.....|.....+.....|.....+.....|
```

Possible results: ok / not done / error.

CHECK SIGNAL ACTIVATION

Command format: ID + K + x <cr>

Example: if ID=14 and you want to enable the check signal type 14K1 <cr> or 00K1 <cr>

Response of the unit: <cr> <lf> ID + K + x <cr> <lf> command executed correctly

Response of the unit: none command failed

Set the parameter:

x=0 to disable the check signal

x=1 to enable the check signal

The enable check signal allows to have information about:

- dirty or damaged lens' surface (see the command "Check fouling" to set the alarm limit);
- the probe is not well immersed into the sample or there are air bubbles close to the lens (see the command "Check dry" to set the alarm limit);
- the ambient light is too high and saturates the turbidity signal.

CHECK FOULING

Command format: ID + F + x <cr>

Example: if ID=14 and you want to set the alarm for dirty cell to 10% of the check signal type 14F10 <cr> or 00F10 <cr>

Response of the unit: <cr> <lf> ID + F + x <cr> <lf> command executed correctly

Response of the unit: none command failed

Command for setting the alarm limit of the dirty or damaged lens surface.

BAUD RATE

Command format: ID + B + x <cr>

Example: if ID=14 and the new speed is 2 = 4800 baud type 14B2 <cr> or 00B2 <cr>

Response of the unit: <cr> <lf> ID + B + x <cr> <lf> command executed correctly

Response of the unit: none command failed

The probe activates the new baud rate immediately after the response to the command.

Set parameter:

x=1 for 2400 baud

x=2 for 4800 baud

x=3 for 9600 baud

x=4 for 19200 baud

COMMANDS USING ID + SNxxxxxx

From release R3.00 it has been added the possibility to query the probes by inserting the serial number of the probe in addition to the ID for all the commands provided.

Example: the command to acquire the measurement of a probe with ID=14 and SN123456 can be performed with:

| | |
|---------------------------------|--------------------------------------|
| interrogation using ID | 14A <cr> or 00A <cr> |
| interrogation using ID+SNxxxxxx | 14SN123456A <cr> or 00SN123456A <cr> |

The interrogation with ID + SNxxxxxx becomes a unique command thus allowing to be able to insert more than 99 devices on the network, limit imposed by the commands with ID.

A command is also provided with serial number broadcast ID + SN000000 to which all the probes respond.

SEARCH PROBE TYPE, ID AND SERIAL NUMBER

Command format: ID + SN? <cr>

Example: if the ID is known (ID=14) type 14SN? <cr> to know code and serial number or type 00SN? <cr> to search all the probes in the network.

Response of the unit: <6 characters code> <2 characters ID> <6 characters serial number> <2 characters BCC> <cr> <lf> command executed correctly

Response of the unit: none command failed

Record format:

```
TU8355,14,123456,xx
....+....|....+....|
```

This command allows to search all the probes in a network.

The probes respond by providing their identity: code, ID, serial number.

The probe response occurs after a random time chosen by the probe itself between 8 time intervals: 0 ms, 200 ms, 400 ms, 600 ms, 800 ms, 1000 ms, 1200 ms, 1400 ms to avoid as much as possible an overlap of the answers when there are more probes on the network.

If there are more probes, some overlap of communication will be unavoidable.

The master device must manage the probes search by disabling the commands of the probes it has found, repeating the search command several times until it has found all the probes in the network.

At this point the master can re-enable the commands of the probes he has found.

To disable and re-enable the probe commands, see the command ID + SNxxxxxx + MUX <cr>.

The automatic management of probes is implemented in the MC 6587 and MC 7687 instruments of the B&C Electronics.

6.4.2 MODBUS PROTOCOL

On the probe, in addition to the ASCII B&C protocol, is implemented the Modbus RTU protocol limited to the function 03.

In Modbus communication network the probe operates as a slave device.

RTU transmission mode

| | |
|---------------------------------|--------------|
| Coding system | 8-bit binary |
| Number of bits per character: | |
| - start bits | 1 |
| - data bits (minus sign before) | 8 |
| - parity | no parity |
| - stop bits | 1 |
| Errors verification | CRC-16 |

RTU messages format

| | |
|---------------------|----------------------|
| Pause transmission | duration 3,5 bytes |
| Address | 1 byte (8 bits) |
| Function | 1 byte (8 bits) |
| Data | N bytes (N x 8 bits) |
| Errors verification | 2 bytes (16 bits) |
| Pause transmission | duration 3,5 bytes |

For a correct synchronization of the transmission the receiving unit interprets the end of a message when it doesn't receive any characters (bytes) for a time equivalent to the transmission of 3.5 characters (bytes).

MODBUS FUNCTION 03 (0x03)

Function 03 (MASTER QUERY)

| | | |
|------------------------|---------|---|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 03 (read holding register) |
| Start address data HI | 1 byte | Start address of registers |
| Start address data LO | 1 byte | |
| Number of registers HI | 1 byte | Number of registers (2 byte x register) |
| Number of registers LO | 1 byte | |
| Errors verification | 2 bytes | CRC-16 |

The transmitter considers valid the message if CRC-16 valid, ID valid and function=03.
Function 03 (SLAVE ANSWER)

| | | |
|-----------------------------|---------|-----------------------------|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 03 (read holding register) |
| Number of byte of sent data | 1 byte | 2x number of sent registers |
| N byte of data | N byte | Values of registers |
| Error verification | 2 bytes | CRC-16 |

If you query requesting registers outside the defined limits, the probe answers assigning zero to all of the registers out of range.

If an error occurs in the request, the response takes the following form:

| | | |
|--------------------|---------|--|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 0x83 (read holding register + error) |
| Error | 1 byte | 2 = illegal data address 3 = illegal data value |
| Error verification | 2 bytes | CRC-16 |

Time between the end of the query and the beginning of the response about 100 ms.

MODBUS FUNCTION 06 (0x06)

Function 06 (MASTER QUERY)

| | | |
|--------------------------|---------|----------------------------|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 06 (write single register) |
| Address data HI | 1 byte | Address of the register |
| Address data LO | 1 byte | |
| Value of the register HI | 1 byte | Value to be written |
| Value of the register LO | 1 byte | |
| Errors verification | 2 bytes | CRC-16 |

The transmitter considers valid the message if CRC-16 valid, ID valid and function=06.
Function 06 (SLAVE ANSWER)

| | | |
|--------------------------|---------|----------------------------|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 06 (write single register) |
| Address data HI | 1 byte | Address of the register |
| Address data LO | 1 byte | |
| Value of the register HI | 1 byte | Value to be written |
| Value of the register LO | 1 byte | |
| Errors verification | 2 bytes | CRC-16 |

When writing some calibration commands (eg zero calibration), the probe responds to the request and then remains silent for the time necessary to perform the operation. If an error occurs in the request, the response takes the following form:

| | | |
|--------------------|---------|--|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 0x86 (write single register + error) |
| Error | 1 byte | 2 = illegal data address 4 = slave device failure |
| Error verification | 2 bytes | CRC-16 |

Time between the end of the query and the beginning of the response about 100 ms.

MODBUS FUNCTION 16 (0x10)

Function 16 (MASTER QUERY)

| | | |
|------------------------|---------|---|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 16 (write multiple registers) |
| Start address data HI | 1 byte | Start address of registers |
| Start address data LO | 1 byte | |
| Number of registers HI | 1 byte | Number of registers (2 byte x register) |
| Number of registers LO | 1 byte | |
| Number of byte | 1 byte | 2 byte per register |
| Value of registers | n byte | n = 2 byte x number of registers |
| Errors verification | 2 bytes | CRC-16 |

The transmitter considers valid the message if CRC-16 valid, ID valid and function=16.
Function 16 (SLAVE ANSWER)

| | | |
|------------------------|---------|---|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 16 (write multiple registers) |
| Start address data HI | 1 byte | Start address of registers |
| Start address data LO | 1 byte | |
| Number of registers HI | 1 byte | Number of registers (2 byte x register) |
| Number of registers LO | 1 byte | |
| Errors verification | 2 bytes | CRC-16 |

When writing some calibration commands (eg zero calibration), the probe responds to the request and then remains silent for the time necessary to perform the operation.
If an error occurs in the request, the response takes the following form:

| | | |
|--------------------|---------|--|
| Address | 1 byte | 1 ÷ 243 (probe ID) |
| Function | 1 byte | 0x90 (write multiple registers + error) |
| Error | 1 byte | 2 = illegal data address 3 = illegal data value 4 = slave device failure |
| Error verification | 2 bytes | CRC-16 |

Time between the end of the query and the beginning of the response about 100 ms.

BROADCAST COMMANDS

Modbus 06 and 16 queries can be made by the master in broadcast mode.

The broadcast mode consists in sending the message with the identifier 0, all the probes perceive the message and execute the command but do not respond to the master in order not to create conflicts.

MODBUS REGISTERS

MEASURE AND STATE (address 0x00xx)

Use of BCC EEPROM

The EEPROM BCC check is the probe configuration state synthesis. After setting the parameters and carry out the calibration the value of the BCC remains constant until the next change of parameters or calibration.

A variation of BCC in the absence of changes warns that an alteration has taken place in the probe configuration data.

7 MAINTENANCE

The optical lens at the bottom of the probe should be inspected and cleaned periodically.

Cleaning is recommended before zero and sensitivity calibration.

Remove any deposit on the optical lens by using a soft, damp cloth or paper towel without pushing on the surface to avoid scratching it.

If necessary, use a soft detergent or a very dilute acid if the deposits are of limestone type.

The frequency of cleaning depends on the type of use, the nature and the concentration of the measuring sample.

The probe TU 8355 is designed for automatic cleaning by means of an external system that sends air to the probe. Do not exceed the pressure of 3 bar and the duration of 10 seconds.

Contact our sales department for more information.

During these operations avoid removing the cable gland.

This removal is reserved to the manufacturer and if carried out by the operator it will damage the internal circuits voiding the warranty.

7.1 CALIBRATION

The probe is supplied with a factory calibration of the zero and sensitivity done with known standard solutions.

Checking and periodic calibration of the probe is always necessary to ensure the accuracy of the measure.

The optical components can have small drifts during the life.

The cleanliness of the optical lens is an important element to check before making a new calibration. If necessary, clean them with a soft cloth.

Is suggested to run the zero calibration before the sensitivity calibration.

The check signal calibration must be performed with the probe immersed in the liquid without the presence of air bubbles on the surfaces of the optical lens.

Zero calibration

The zero calibration must be performed in the zero standard solution or in water with known turbidity value next to zero.

Calibration is performed on all the scales following the procedures described in chapter "ZERO CALIBRATION (page 30)".

Sensitivity calibration

It is done in formazine solution or in a known turbidity value solution following the procedure in chapter "SENSITIVITY CALIBRATION (page 32)".

We recommend values not lower than 50 FTU.

Reset of zero and sensitivity calibration

To reset the zero and the sensitivity of the probe to factory settings follow the procedures described in sections "ZERO CALIBRATION RESET (page 31)" e "SENSITIVITY CALIBRATION RESET (page 32)".

Probe's accuracy verification

For TU 8555 is available the dry turbidity simulator TU 9632 that allows to verify the accuracy of the measurement using 10000 FTU scale.

Contact our Sales Department for more details.

TSS calibration

The TSS calibration is made by choosing the appropriate conversion coefficient TSS/FTU in order to visualize the value of suspended solids contained in the sample detected through the appropriate laboratory procedures.

It is suggested to set the value of the conversion coefficient after turbidity calibration.

8 INSTALLATION DRAWINGS

8.1 TU 8355 - DIMENSIONS

Description

- | | |
|---|--------------|
| 1 | Cable |
| 2 | Air input |

8.4 ANALOG MODE WIRING

The connection shown in the figure is possible for all models.

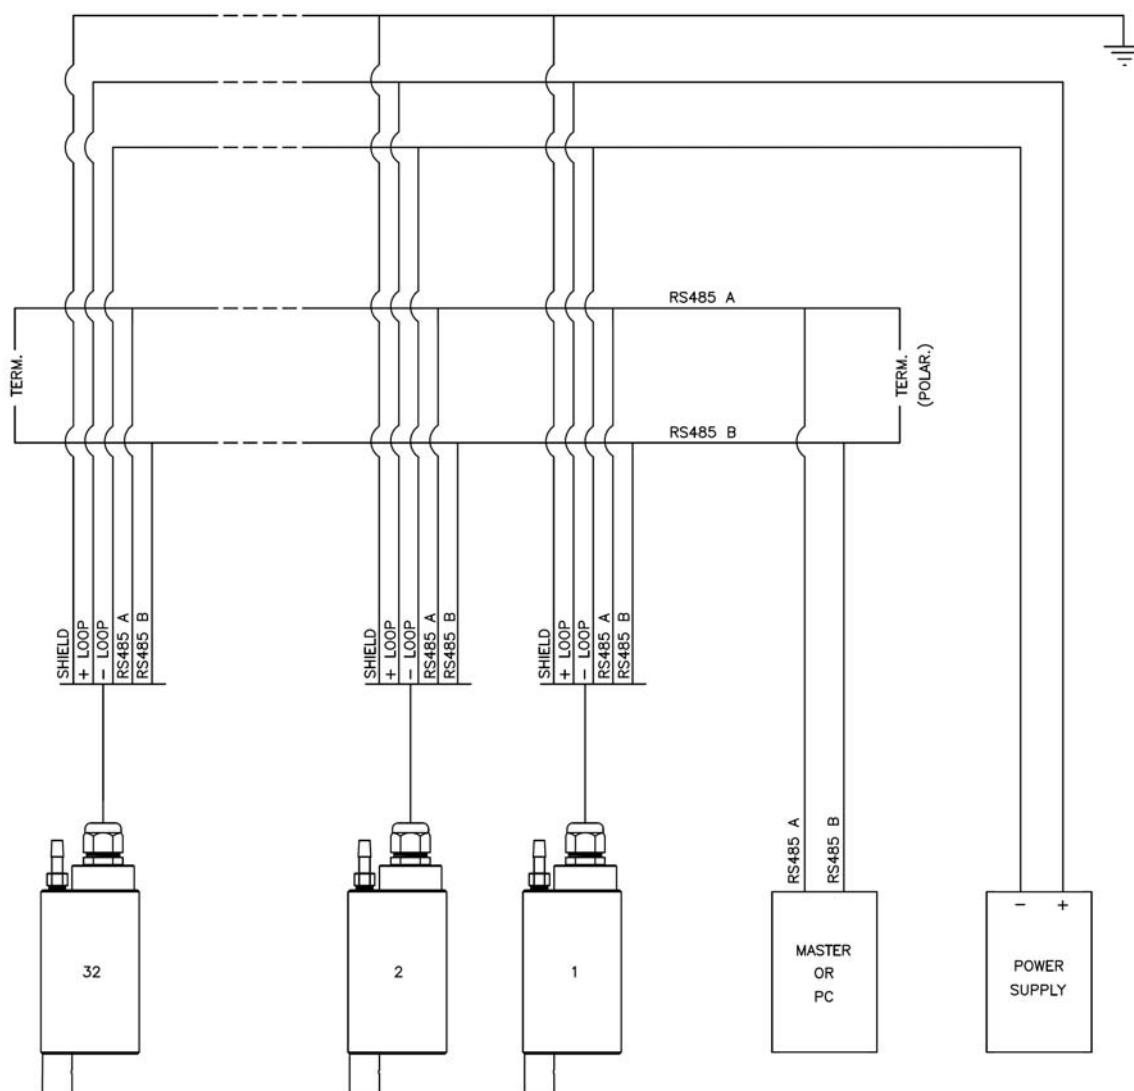

Connection to B&C Electronics' instruments

Connection to PLC or data logger

8.5 DIGITAL MODE WIRING

The connection shown in the figure is possible for all models.

9 WARRANTY

- 1 Your product is guaranteed for 5 years from the date of purchase, for failure due to manufacturing defects.
 - 2 The warranty is void in case of tampering or deterioration due to improper installation or maintenance.
 - 3 The warranty covers only free repair at the laboratories of the manufacturer.
 - 4 B&C Electronics is not liable for any damage arising from misusing its instruments and products.
-

10 REPAIRS

For faster and efficient service it is recommended to fill in the "Information card" for the repair service and attach it to a "Repair order".

- 1 The estimated cost, if required by the customer, is free if the repair is confirmed. Otherwise flat rate results in a charge for the analytical work performed and expenses incurred.
- 2 The products to be repaired must be sent to B&C Electronics with freight prepaid. Any expenses incurred on behalf of the client and not previously agreed will be charged.
- 3 Our sales department will submit to the customer the repair estimate or offer a replacement in the following cases:
 - repair cost is considered excessive in relation to the cost of the product;
 - the repair is technically impossible or unreliable.
- 4 In order to reduce the time of delivery of the repaired products, unless otherwise offered or arranged by the customer, the shipment will be made with ex-factory, prepaid carriage by a courier.

INFORMATION SHEET
for service repairs

In the event of a fault, we recommend you contact our repair service, to photocopy and complete this information sheet to be attached to the product to be repaired.
